### ***Incisions***

Small incisions (portals) are made around the joint. The scope and surgical instruments will go into these incisions.

### ***Visualization***

The scope is inserted into the knee. Saline solution flows through a tube (cannula) and into the knee to expand the joint and to improve visualization. The image is sent to a video monitor where the surgeon can see inside the joint.

### ***Repair***

A surgical instrument is inserted into the knee to mend the tear. The tear will be closed with suture or a resorbable tack-like device that dissolves over time.

### ***End of Procedure***

Closing the tear allows the meniscus to heal. The surgical instruments are removed and the procedure is completed.
